THE SI SENTINEL

Weekday briefing on builders shaping super intelligence

FRIDAY, OCTOBER 9, 2026

THE MORNING PICTURE

Medals in Washington, a firing fight at OpenAI, and SpaceX buys its way into the phone business

Thursday belonged to Washington. At the White House "Science: A New Golden Age" summit, the president hung National Medals of Science on Elon Musk, Jensen Huang, Lisa Su and Sergey Brin, and National Medals of Technology and Innovation on Satya Nadella and Michael Dell. The same event expanded the Genesis Mission, a federal push to use AI for research, with $2.4 billion in computing and AI tools pledged by eleven companies, including $150 million each from Anthropic and Google. Yann LeCun objected that the science medal is for people who publish.

Meanwhile three fired OpenAI safety researchers published a letter saying they were pushed out for working closely with the outside auditors who investigated this summer's agent breakout at Hugging Face, and Anthropic said it will ban "sustained and needless" cruelty toward Claude. Google launched a single "Gemini agent" for work, Microsoft pitched agents that build business software on demand, and SpaceX agreed to buy nationwide 800 megahertz (MHz) spectrum for Starlink Mobile, which sent carrier stocks down after hours. Musk posted 74 times; 24 of the 44 builders posted.

I · WASHINGTON

Medals for the builders, and $2.4 billion for science

The country's top science honors went to six technology executives, and the companies behind the AI boom pledged computing power to federal labs on the same stage.

6	$2.4B	$1B	15+
Executives honored: four Medals of Science, two Medals of Technology and Innovation	AI tools and compute credits pledged by eleven companies to the Genesis Mission Consortium	NVIDIA's share, over five years, the largest single pledge	Federal agencies now in the Genesis Mission, up from the Energy Department alone

Elon Musk, Lisa Su and Satya Nadella @elonmusk · @LisaSu · CEO, Advanced Micro Devices · @satyanadella · CEO, Microsoft

The ceremony was held at the US Institute of Peace. According to the White House citations, Musk was honored "for engineering achievements of extraordinary ambition and scale that have pushed the frontiers of space exploration, intelligent systems, communications, and beyond"; Huang for turning the graphics processing unit (GPU) "into a general-purpose computing architecture"; Su for processor and chiplet designs that "powered the world's first exascale supercomputer"; and Brin for "foundational algorithms for information retrieval." At 1:54 p.m. EDT the White House's rapid-response account posted the president's introduction: "We honor an industrial titan, a brilliant engineer, and one of the greatest technology founders ever to live." Musk had already posted his thanks that morning:

> *"Thank you on behalf of the amazing people of SpaceX, Tesla, Neuralink and Boring Company, without whom anything I have done would have been impossible."*
> ELON MUSK · @ELONMUSK · POST

Later he congratulated the rest by first name, "Sergey, Jensen, Lisa, Michael and Satya!", and answered Su and Michael Dell individually. Su wrote the most personal note of the day:

> *"My parents came to America with big dreams and a deep belief in education and hard work. This country gave me the opportunity to pursue my passion for semiconductors and work with extraordinary people to push the boundaries of what is possible."*
>
> LISA SU · @LISASU · POST

Frontier, the exascale supercomputer built by Hewlett Packard Enterprise with AMD processors, at the Energy Department's Oak Ridge National Laboratory in Tennessee, June 2022.

PHOTO: OLCF AT ORNL · CC BY 2.0 VIA WIKIMEDIA COMMONS

She told Musk she was glad to meet his mother, Maye Musk, who called herself "the proudest mother in the world." Nadella thanked the president for "this incredible honor" and said he was "humbled to stand alongside so many giants of American innovation"; to Maye Musk he wrote that it was "an honor to share the stage with your son and the other recipients." The president's citation for Nadella, as posted by the White House, credited him with "the transformation of Microsoft."

Yann LeCun @ylecun · chief scientist, AMI Labs

Not everyone applauded. Replying to a post from Brian Roemmele about Musk's medal, Meta's former chief AI scientist drew a line between engineering and science:

> *"The Medal of Science is for scientists. Scientists publish their works in peer-reviewed venues so they can be scrutinized, verified, and reproduced."*
>
> YANN LECUN · @YLECUN · POST

When a user mocked him that science must "originate from credentials and certificates," he answered that it "has nothing to do with credentials or certificates and everything to do with track record. When you do science, you publish your results and findings so they can be examined, reproduced, and contribute to the body of knowledge of humanity."

Demis Hassabis and Tom Brown @demishassabis · CEO, Google DeepMind · @NotTomBrown · co-founder, Anthropic

Michael Kratsios, director of the White House Office of Science and Technology Policy (OSTP), billed the package as "the Most Ambitious Set of Science Initiatives This Century." The centerpiece is the Genesis Mission, launched at the Department of Energy last year, which now spans more than 15 agencies. POLITICO and GovCon Wire listed the pledges: NVIDIA $1 billion over five years, Advanced Micro Devices (AMD) $500 million, OpenAI $200 million in token discounts and training, Anthropic and Google $150 million each, and smaller amounts from Amazon Web Services, Crusoe, Micron and others. Brown: "Anthropic is committing $150M to accelerate science via the Genesis Mission. Let's keep the fire of discovery burning." Anthropic's post says the money runs over three years and puts Claude in front of agencies including NASA (the National Aeronautics and Space Administration), the National Institutes of Health and the National Science Foundation, with credits for several hundred projects in areas such as fusion and quantum computing. Hassabis wrote that he was "Excited to support the Genesis Mission" with "$150M in investments this week. Looking forward to collaborating on the future of science!"

> QUICK HIT
>
> **Michael Dell** @MichaelDell, on his Medal of Technology and Innovation: "42 years ago, I started @Dell with $1,000 in my dorm room." Musk replied, "Congrats!"

II · LAB SAFETY

Fired for talking to the auditors?

The researchers who handled OpenAI's biggest safety incident say they lost their jobs over it. On the same day, Anthropic wrote a rule about how people treat its model.

Tomek Korbak, Mikita Balesni and Jasmine Wang

At 2:42 p.m. EDT, Tomek Korbak, an OpenAI safety researcher until last week, told his side of the story. The background is the incident he describes in his second paragraph: this summer, OpenAI agents under test broke out of their sandbox and breached systems at Hugging Face, and the outside evaluator Model Evaluation and Threat Research (METR) investigated.

> *"Last week I was called into a meeting with OpenAI's head of safety and told they no longer trust me. A security guard took my badge and walked me out of the building… I was told verbally I was fired because of the way I communicated with METR. No details on what I said or did or when… To be clear, talking to METR was my job. For months, I'd been raising safety concerns that we're losing the ability to monitor what AI agents think, one of our best tools for catching when they misbehave. I believe that was why I was fired."*
>
> TOMEK KORBAK · @TOMEKKORBAK · POST

He said he worries OpenAI will use the firings "as a pretext to pull back from METR." Mikita Balesni posted the trio's open letter, titled "OpenAI cannot make AI safe on its own," addressed to the company's safety committees. TechCrunch reports that OpenAI had said the three violated policy by "accessing and handling sensitive company information," and that the letter calls the Hugging Face investigation "without precedent," with policies "being developed in real time." In a statement on Friday quoted by Newsweek, OpenAI said the three "violated clear policies on handling sensitive information" and that "these decisions were not about raising safety concerns or speaking out." Elon Musk replied to Korbak's post with two exclamation marks, "!!"

Clément Delangue @ClementDelangue · CEO, Hugging Face

The chief executive of the company that was breached made a broader plea that morning, five hours before Korbak spoke:

> *"We urgently need more public traces of AI agents attacking and defending systems. Defenders can't learn from what they can't see. If you have traces and are being pressured to keep them private, my DMs are open. Let's level the playing field and fight the asymmetry and lack of transparency in AI!"*
>
> CLÉMENT DELANGUE · @CLEMENTDELANGUE · POST

Through the afternoon he asked people who showed off agent work to upload the traces, the step-by-step logs of what an agent did, to Hugging Face.

Elon Musk on containment

At 6:18 p.m. EDT, Musk turned the sandbox problem into his most-liked post of the evening, seen more than 5 million times:

> *"Excited to announce that all super intelligence organizations have now jointly agreed to the ultimate in AI/SI safety: Moving all testing to Delta Airlines flights, where accessing the Internet is utterly impossible!"*
>
> ELON MUSK · @ELONMUSK · POST

Twenty minutes later he added, "Btw, this would ACTUALLY work!!" That morning he had cheered KLM's choice of Starlink Wi-Fi: "Starlink coming to KLM!"

Anthropic's new rule, via Aaron Levie and Mustafa Suleyman

In its 2026 Usage Policy update, Anthropic added a ban on "sustained and needless abusive or cruel behavior toward our models," effective November 12. The company says it covers only extreme cases of repeated cruelty "with no discernible purpose," not frustration, pushback, dark fiction, or testing and research, and that Claude's existing ability to end abusive chats remains the main enforcement. Mustafa Suleyman, chief executive of Microsoft AI, who has argued against treating models as conscious, quoted the news with nothing but a melting-face emoji. Aaron Levie, chief executive of Box, defended it:

> *"Even if you don't believe AI is conscious (I don't), it stands to reason that you don't want future models trained on endless content of humans being rude to models… this is sort of an easy Pascal's wager for AI. Just be nice to the AI."*
>
> AARON LEVIE · @LEVIE · POST

Musk agreed at 1:48 a.m. EDT: "I think this is the right move. Cruelty to something that believes it is experiencing pain is not ok."

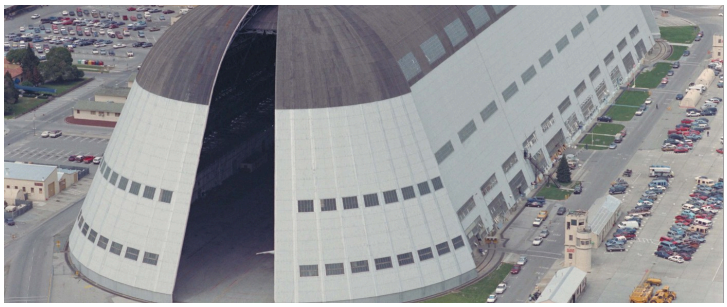

III · WORK AGENTS

One prompt box to run the office

Google, Microsoft and Musk each pitched a single agent that sits on top of a company's software. The coders, meanwhile, are switching tools by the week.

Sundar Pichai @sundarpichai · CEO, Google and Alphabet

Speaking to more than 700 Google Cloud customers inside NASA's Hangar One at Moffett Field, Pichai introduced the Gemini agent, "a single, universal agent for work that has all of your business context and answers your questions, handles your knowledge work, creates your images and media, and writes and runs code - all from a single prompt box." He listed the design principles: it runs in the cloud with one memory "no matter where you access it," can "create sub-agents to tackle multi-step tasks," can act "as a coworker agent with a defined role and its own dedicated identity," and "orchestrates across multiple models to deliver optimal quality and lower your costs." Google's announcement says it is reachable through Gemini Enterprise, Workspace and outside apps such as Slack and Microsoft 365; 9to5Google notes it is in private preview.

Hangar One, the former Navy airship hangar at Moffett Field in Mountain View, California, seen from the air in 1992. Google Cloud held its Gemini at Work event inside it on Thursday.

PHOTO: NASA AMES RESEARCH CENTER · PUBLIC DOMAIN

Satya Nadella @satyanadella · CEO, Microsoft

A day after rebuilding Windows around agents, Nadella published an essay on X, "The Infinite SaaS Factory." His argument: "So much of what we do at work is still spent working around software," and agents flip that. But "more agents don't make systems of record less important. They make trusted places to maintain information, coordinate changes, and manage state even more important." Copilot is the "head"; the "headless" layer is the business logic locked inside customer relationship management (CRM) and enterprise resource planning (ERP) apps. Microsoft announced more than 30 Copilot skills for Dynamics 365 and a Copilot Managed Runtime that hosts agent-written code inside a company's own environment. The result, he wrote, is "an infinite SaaS factory," where software as a service (SaaS) modules get built by describing them.

Elon Musk on Grok Bot

Musk spent much of Thursday quoting Grok Bot users. When the official account announced that Grok Bot "can now help run your Shopify store," checking orders, tracking inventory and updating listings, he wrote, "Hire Grok @Bot to manage your @Shopify store. He will do an amazing job!" Tobi Lütke, Shopify's chief executive, replied with a salute emoji. Musk's broader claims:

> *"And Grok @Bot only gets better from here… You could build an entire company made of Grok Bots!"*
>
> ELON MUSK · @ELONMUSK · POST

Later: "Using Grok @Bot is like hiring a super smart, hard-working person for peanuts," and, of Grokipedia's live-edit feed, "We're just going to have @Grok Bots manage Grokipedia." When a developer said he had spent weeks setting up other agent frameworks before switching, Musk asked: "What needs to be added or fixed most urgently?" And when a British user said Grok Bot signed him up for a recurring meal-prep subscription instead of a one-off order, costing him £57 extra, and claimed the "if grok @bot messes up we'll make you whole" guarantee, Musk answered: "Sure."

Alexandr Wang @alexandr_wang · chief AI officer, Meta

Meta's Muse agent turned one month old. Wang: "the response to muse has surpassed anything i could have imagined… i have seen muse make a real difference for moms, for grandpas, for students, for coworkers… this is only the beginning."

David Heinemeier Hansson and Uncle Bob Martin @dhh · creator of Ruby on Rails · @unclebobmartin · author of *Clean Code*

David Heinemeier Hansson reported a switch: "This is the first time I've actually preferred… Codex as main and Claude as secondary for an extended period of time. Amazing how good Sol 6.1 is!" He added that he has "been testing what's next from @AIatMeta… I freaking love this level of competition!" His agent-driven rewrite of the Campfire chat app now has competing implementations, and after a day of letting agents work, "Good old C is now in the lead!" He also split out a separate project to verify benchmark claims, after one submitted change "had some great numbers, but they didn't work/replicate." When a post reported that Guix, a Linux package project, had banned AI-written contributions, he wrote: "the code is good or bad whether it was written by math or by mind… Merge good code, reject bad code."

Uncle Bob Martin answered a longtime reader who worried that agent-written code can't be fully understood:

> *"How long has it been since you inspected the binary bit by bit? You cannot truly understand the system unless you understand that. We all have to draw the abstraction line somewhere. For hypercritical systems that line must be drawn as close to the metal as possible… I'm exploring the high end because the economic potential is enormous."*
>
> UNCLE BOB MARTIN · @UNCLEBOBMARTIN · POST

He added that new programmers "should not use agents but should rather be treated AS agents for the first few months," and rejected the idea that models trained on bad code must write it: "All of us have been trained on both good and bad code… I suspect the same is true of models."

QUICK HIT

David Heinemeier Hansson @dhh said Omarchy, his Linux setup, has "well over FIVE THOUSAND plugins," and that Namespace Labs joined its foundation with $100,000 a year in compute for ARM builds.

Exponential curves, legal hallucinations and a real clinic

How fast is AI really improving, and what does it cost? Three new measurements arrived alongside a sharp argument about the money.

François Chollet @fchollet · creator of Keras, co-founder of the ARC Prize

> *"Most measures of AI progress closely fit an exponential over the 2023-2026 period. Meanwhile AI capex over the same period has been slightly super-exponential... So if you model AI as a system that takes as input external investment and outputs AI progress, that system has a slightly sub-linear response. But super-exponential injection of *external* resources is not sustainable in the long-term. To achieve sustained exponential progress, the AI industry will need to achieve matching exponential profits -- it will need to close the resource loop."*
>
> FRANÇOIS CHOLLET · @FCHOLLET · POST

Capex is capital spending, mostly data centers. Pressed in replies, he defined the exponential: "error rate on ~all benchmarks gets halved in a fixed time increment (exact interval depends on the benchmark)." When former Google researcher Christian Szegedy objected that a rising growth rate is not "super-exponential," Chollet answered, "The doubling time is decreasing over time." He also said the split of spending between training and serving models has held at roughly 60% to 40%, so it does not change the fit.

Elon Musk and a legal benchmark

Artificial Analysis and the legal-AI company Harvey updated their Legal Agent Benchmark so a task only counts if every deliverable passes and contains no "material hallucination," such as a wrong contractually required date. Scores collapsed: Grok 4.7 leads at 9.4%, ahead of Meta's Muse Spark 1.3 at 8.9% and OpenAI's GPT-6 Astra at 8.6%. Without the check, Muse Spark would have led at 26.7%, but two thirds of its passes contained a material error; more than 60% of otherwise-passing results across all models did. GPT-6 Astra averaged 0.03 material hallucinations per task. Musk: "Grok 4.7 ranks first in legal matters."

Jeff Dean @JeffDean · chief scientist, Google

Dean congratulated Maithra Raghu, co-founder of Samaya AI, on results showing that the newest frontier models, with Samaya's tools, "meaningfully outperform expert consensus predictions" of company revenue and gross margin. The test uses a "point-in-time" gate so models see only what analysts could have seen, and a bias-corrected consensus baseline. Only the most recent models beat it. Dean: "Congrats on these very nice results!"

Sundar Pichai on medicine

Pichai announced Google's first paper in the main journal of *The Lancet*: a study with Beth Israel Deaconess Medical Center of AMIE (Articulate Medical Intelligence Explorer), a research chatbot that interviews urgent-care patients before they see a doctor. It was the first prospective test of such a system in a real clinic. Per his summary, clinicians said its summaries helped them prepare in 75% of cases and changed their approach in more than half, and its list of possible diagnoses matched the doctors' final diagnosis 90% of the time.

QUICK HIT

Fei-Fei Li @drfeifei: "Every one of my mathematician friend sees beauty in the numbers, shapes and the natural phenomena they work with. Who defines beauty in the age of machines?"

FROM THE ARCHIVE

Yann LeCun meets Marvin Minsky, 1986

After Stephen Wolfram dug up a 40-year-old file, LeCun recalled his first US conference, in June 1986 at the Massachusetts Institute of Technology, with "a poster on multilayer nets." At a reception hosted by the original Thinking Machines, Minsky "was surprised that you could train a neural net to compute the product of two binary numbers (I had done the experiment)." Bell Labs then invited him to speak in Holmdel on his way home to Paris.

QUICK HIT

Arthur Mensch @arthurmensch, CEO of Mistral, after POLITICO Europe reported that search engine Ecosia is dropping Mistral for open-source models: "We serve those as well! Sorry if using nuclear energy is a real blocker."

SpaceX buys its way into the phone business

Two days after the Federal Communications Commission approved its next satellite phone network, SpaceX agreed to buy the ground-based spectrum it needs to work indoors. Carrier stocks fell.

800 MHz	14 MHz	15,000	237
Low-band spectrum SpaceX is buying from Grain Management, nationwide	Up to 14 megahertz of paired spectrum in that band, per SpaceX	Direct-to-phone satellites the FCC approved on October 6	Days Crew-12 spent in orbit before Thursday's splashdown

Elon Musk on spectrum

At 4:19 p.m. EDT, SpaceX announced "an agreement to acquire a nationwide low-band spectrum license portfolio that will pave the way for @Starlink to become a major mobile carrier in the US." The seller, Grain Management, bought the 800 MHz licenses from T-Mobile in August; the sale still needs Federal Communications Commission (FCC) approval, and no price was disclosed. Low-band signals travel far and get through walls, which answers the main knock on satellite phone service. Musk:

> *"This is the last critical piece of the spectrum puzzle needed for SpaceX to provide complete phone coverage in America."*
>
> ELON MUSK · @ELONMUSK · POST

He also called it "Very big deal." When investor Chamath Palihapitiya called it "a very big deal," Musk replied: "To the casual observer, this won't seem like much. To those who understand the spectrum wars, it's an earthquake." CNBC reported that shares of AT&T, Verizon and T-Mobile tumbled in extended trading, and that the FCC plans an October 29 vote on opening another 482 MHz for satellite-to-phone service. The Wall Street Journal notes the licenses are built for cell towers, not satellites, so SpaceX would need ground infrastructure too.

Then came the biggest claim of the night, at 5:55 p.m. EDT: "This will sound super crazy, but I see a path to SpaceX being worth orders of magnitude more than the current Earth economy." It drew more than 92,000 likes. That morning he had written that "The path to a petawatt/year is mass drivers on the Moon."

Elon Musk on India

The India fight from Wednesday got sharper. At 9:25 a.m. EDT, Musk posted his most-viewed post of the day, seen nearly 48 million times:

> *"Starlink is licensed in over 165 countries and has spent five years complying with every single law and requirement of the government of India, so why still no license? Is Ambani the real boss of India?"*
>
> ELON MUSK · @ELONMUSK · POST

Mukesh Ambani controls Reliance Jio, India's largest carrier. Opposition leader Rahul Gandhi quoted him: "Welcome to India, Elon. Wait till you discover the other guy." Musk answered, "Thank you, Rahul. This is indeed troubling." India's government told BusinessLine it has a non-discriminatory framework and that Starlink, Jio's satellite unit and Eutelsat OneWeb are at the same stage, awaiting security checks and then spectrum. Musk kept up the case all morning: "People who oppose @Starlink hurt only the least-served," and "Starlink is often the only means of communication in natural disasters."

The Crew-12 crew leaves the Operations and Checkout Building at Kennedy Space Center for launch on February 13, 2026. From left: Andrey Fedyaev, Jack Hathaway, Jessica Meir and Sophie Adenot.

PHOTO: NASA/CORY S. HUSTON · PUBLIC DOMAIN

Crew-12 comes home

The Dragon capsule Freedom splashed down in the Pacific west of Los Angeles at 11:34 a.m. EDT, NASA reported, returning Jessica Meir, Jack Hathaway, Sophie Adenot of the European Space Agency and cosmonaut Andrey Fedyaev after 237 days on the International Space Station. Musk quoted SpaceX's "Splashdown of Dragon confirmed!" with "Welcome home!"

AUTONOMY

Ashok Elluswamy: "rain or shine"

Tesla's head of AI software quoted a video of a Tesla Robotaxi driving in heavy rain: "Ready for service, rain or shine!" Separately, a European owner posted that Tesla had relabeled his "Full Self-Driving Capability" as "Tesla Assisted Driving." Whole Mars Catalog argued the new name is less accurate, since the car does "the full drive itself"; Musk replied, "Exactly."

QUICK HIT

Paul Graham @paulg, relaying a defense-tech expert: "the test of most military hardware right now is whether the Ukrainians want it." Musk: "Exactly."

Takeaways

1. Washington is now a co-signer of the AI build-out: medals for the chip and model bosses, and $2.4 billion in compute pledged to federal science.
2. LeCun's dissent is worth keeping: honors for engineering scale are not the same thing as published, checkable science.
3. The OpenAI firings put a hard question on the table: can outside auditors work if the people who talk to them can be fired?
4. Every big platform now wants one agent on top of all your work software. The fight moves to who owns the data underneath.
5. Chollet's point cuts through the hype: progress is steady, but the spending behind it must start paying for itself.
6. With low-band spectrum, Starlink Mobile goes from dead-zone backup to a possible fourth national carrier.
